Project Requirement Analysis

Introduction

The project is developed to import and manage employee information in the ServiceNow platform. The employee data is initially maintained in an external Excel spreadsheet. The data is imported into ServiceNow using Import Sets and Transform Maps. The system provides an efficient method for transferring large amounts of employee information and maintaining data accuracy.

The project also includes Coalesce functionality to prevent duplicate employee records. Reports and dashboards are created to provide a clear view of employee information.

Existing System

In the existing manual system, employee information may be maintained in spreadsheets and entered manually into the ServiceNow system. This process can take more time when a large amount of data has to be entered.

Manual data entry can also result in:

- Duplicate employee records
- Incorrect information
- Data entry mistakes
- Difficulty in updating existing records
- Time-consuming data management
- Difficulty in generating reports

Therefore, an automated data import process is required.

Proposed System

The proposed system uses **ServiceNow Import Sets and Transform Maps** to import employee data from an Excel spreadsheet.

The basic process is:

Excel Spreadsheet → Import Set Table → Transform Map → Employee Test Table → Reports → Dashboard

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

The spreadsheet data is first loaded into an Import Set table. The Transform Map maps the source fields to the corresponding target fields. After transformation, the employee records are created or updated in the target table.

Functional Requirements

The system should provide the following functions:

1. Create an Employee Test table.
2. Create employee fields such as Employee ID, Employee Name, Email, Department and Location.
3. Create an Employee Import table.
4. Load Excel spreadsheet data into the Import Set.
5. Create a Transform Map.
6. Map source fields with target fields.
7. Transform the imported data.
8. Verify the imported employee records.
9. Enable Coalesce to avoid duplicate records.
10. Generate employee reports.
11. Create an employee dashboard.

Hardware Requirements

The project does not require high-end hardware because the application is implemented using the ServiceNow platform.

Minimum Hardware Requirements:

- Computer or laptop
- Intel/AMD processor
- Minimum 4 GB RAM
- Minimum 10 GB free storage
- Keyboard and mouse
- Internet connection
- Monitor/display

A stable internet connection is required because ServiceNow is accessed through a web browser.

Software Requirements

The following software requirements are needed:

- **Operating System:** Windows/Linux/macOS
- **Platform:** ServiceNow
- **Browser:** Google Chrome, Microsoft Edge or Mozilla Firefox
- **Spreadsheet Software:** Google Sheets or Microsoft Excel
- **Internet Connection:** Required

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

- **ServiceNow Modules:** Import Sets, Transform Maps, Reports and Dashboards

The project specifically uses a spreadsheet to prepare sample employee data before importing it into ServiceNow.

Data Requirements

The system requires employee information in spreadsheet format.

The main employee fields are:

Field	Type
Employee ID	String
Employee NAME	String
Email	String
Department	String
Location	String

These fields are created in the Employee Test table and are used during the transformation process.

The Import Set table is used as a staging area for the spreadsheet data before it is transferred to the target table.

Transform Map and Data Validation Requirements

The Transform Map is an important part of the project. It connects the source Import Set table with the Employee Test target table.

The Transform Map is configured with:

- Name: **Sample Spreadsheet Import**
- Source Table: **Employee Import**
- Target Table: **Employee Test**

The fields are mapped using Auto Map Matching Fields and Mapping Assist. After mapping, the data is transformed into the target table.

The system must also verify that the transformation is successful and that employee records are available in the Employee Test table.

Duplicate Prevention, Reports and Dashboard Requirements

The system should prevent duplicate employee records when the same data is imported multiple times. For this purpose, **Coalesce** is enabled on a field such as Employee ID.

When an existing Employee ID is found, the existing record can be updated instead of creating another duplicate record.

The project also requires three reports:

1. **Employees by Department** – Pie Chart
2. **Employees by Location** – Bar Chart
3. **Employee List Report** – List format

These reports are added to an **Employee Analytics Dashboard**.

Performance, Security and Conclusion

The system should process employee data efficiently and maintain accurate records. It should provide proper validation after every import and transformation.

The dashboard provides a centralized view of employee information. It can show employee records, department-wise distribution, location-wise information, and import-related information.

Security Requirements:

- Only authorized users should access employee data.
- Access to dashboards and reports should be controlled.
- Users, groups and roles can be restricted through sharing options.

Conclusion:
The project provides an efficient way to import employee data into ServiceNow. Import Sets and Transform Maps simplify data migration, while Coalesce helps maintain data integrity by avoiding duplicate records. Reports and dashboards provide a centralized and visual way to monitor employee information.
